Cointegration And Error Correction Definition

Cointegration and Error Correction The tendency of cointegrated variables to revert to common stochastic trends is expressed in terms of error-correction . If y_t is an n -dimensional time series and β is a cointegrating vector, then the combination $\beta' y_t - 1$ measures the "error" in the data (the deviation from the stationary mean) at time $t - 1$.

suggested by Granger, is here extended and used to develop estimation procedures, tests, and empirical examples. A vector of time series is said to be cointegrated with cointegrating vector α if each element is stationary only after differencing while linear combinations $\alpha'x_t$ are themselves stationary.

INTEGRATION, CO-INTEGRATION, AND ERROR CORRECTION It is well known from Wold's theorem that a single stationary time series with no deterministic components has an infinite moving average representation which is generally approximated by a finite autoregressive moving average process.

Definition - What does Error Correction mean? Error correction is the process of detecting errors in transmitted messages and reconstructing the original error-free data. Error correction ensures that corrected and error-free messages are obtained at the receiver side. Techopedia explains Error Correction

What is Error Correction? - Definition from Techopedia

The term error-correction relates to the fact that last-period's deviation from a long-run equilibrium, the error, influences its short-run dynamics. Thus ECMs directly estimate the speed at which a dependent variable returns to equilibrium after a change in other variables.

If a set of variables are cointegrated, then there exists a valid error correction representation of the data, and viceversa. If y and x are both $I(1)$ and have a long run relationship, there must be some force which pulls the equilibrium error back to zero.

Cointegration - Wikipedia

As we will see it is more convenient to analyse such forms of cointegration in a multivariate setting, where we make use of the vector autoregression (VAR) model we have discussed previously. For example, consider a first-order VAR (1) for the $n \times 1$ vector $y_t = [y_{1,t}, y_{2,t}, \dots, y_{n,t}]'$, $y_t = \mu + \Pi_1 y_{t-1} + u_t$.
