A Grignard reagent or Grignard compound is a chemical compound with the generic formula  $R-Mg-X$ , where X is a halogen and R is an organic group, normally an alkyl or aryl. Two typical examples are methylmagnesium chloride  $Cl-Mg-CH_3$  and phenylmagnesium bromide  $-Mg-Br$ . They are a subclass of the organomagnesium compounds Grignard compounds are popular reagents in organic synthesis for creating new carbon-carbon bonds. For example, when reacted with another halogenated compound R ...

Grignard reactions have a lot of importance. They form carbon-carbon bonds readily. The synthesis of thousands of alcohols is possible because of Grignard reactions. The Grignard reagent also aids alkyl chains to couple. Magnesium is less electronegative as compared to carbon. The carbon-metal bond is an ionic bond in the Grignard reagent.
