For the last example above, FOILing works for this kind of multiplication, if you learned that method. But whatever method you use, remember that multiplying and adding with complexes works just like multiplying and adding polynomials, except that, while  $x^2$  is just  $x^2$ ,  $i^2$  is  $-1$ . You can use the exact same techniques for simplifying complex-number expressions as you do for polynomial ...

Vector addition is one of the most common vector operations that a student of physics must master. When adding vectors, a head-to-tail method is employed. The head of the second vector is placed at the tail of the first vector and the head of the third vector is placed at the tail of the second vector; and so forth until all vectors have been added.
