on most engines maximum torque falls somewhere between about 55 percent and 80 percent of max RPM. (Light gas engines tend to have peak torque at lower engine RPMs and heavy diesels at higher RPMs.) The units for the torque curve are in kgm (kilogram meters) and Nm (Newton meters). This is the metric equivalent of pound feet. We're not

power curve:  $P_b = c \cdot n^3$ , in which:  $P_b$  = engine power for propulsion  $n$  = propeller speed  $c$  = constant The power functions  $P_b = c \cdot n^i$  will be linear functions when using logarithmic scales. Therefore, in the Layout Diagrams and Load Diagrams for diesel engines, logarithmic scales are used, making simple diagrams with straight lines. Propeller ...

A typical engine performance curve is shown below: Fig.1: Engine Performance Torque Curve. Torque curve (shown in Dark red color) is the graph plotted between torque and RPM of the engine. Normally it also plotted along with the HP curve of the engine (shown in green). You must observe that as the RPM increases, both the curve become steeper.

Marine, like any other usage, requires the buyer to clearly specify the nature of the vessel's usage. So why not buy the greatest available horsepower from a given engine? The answer is engine life (for more information on engine life, see How Long Will a (Marine) Diesel Engine Last?). Engines have a design life at a given power output.

It is interesting to note that the formula also verifies the typical torque bell curve when the torque trails off as rpm increases at the top end. One may consider that engines making torque at a lower rpm tend to work better in marine applications due to the fact that "most" boats tend to plane in the range of 2,000 - 3,000 rpm.
