Physical Treatment - an overview | ScienceDirect Topics

Water treatment is any process that improves the quality of water to make it appropriate for a specific end-use. The end use may be drinking, industrial water supply, irrigation, river flow maintenance, water recreation or many other uses, including being safely returned to the environment. Water treatment removes contaminants and undesirable components, or reduces their concentration so that ...

Water treatment - Wikipedia

The PO*WW*ERTM system is a two step wastewater treatment system comprised of evaporation and catalytic oxidation. The incoming oil/water mixtures can also be treated with this system. The mixtures are concentrated in the evaporation stage to produce brine slurry. This slurry is sent to stabilisation.
