**Predictive Maintenance Beyond Prediction of Failures**  
Predictive maintenance is a proactive maintenance strategy that tries to predict when a piece of equipment might fail so that maintenance work can be performed just before that happens. These predictions are based on the condition of the equipment that is evaluated based on the data gathered through the use of various condition monitoring sensors and techniques.

Predictive maintenance is a way to minimize both failures and maintenance work, while maximizing machinery and component lifetime.

**What is Predictive Maintenance? A Complete Guide**  
Predictive maintenance can result in significant cost savings that can justify transformation of entire maintenance systems. In Europe, it's estimated that between 1.6 and 6.8 billion Euros could be saved via implementation of predictive maintenance, an overall gain of at least 10 percent of maintenance expenditures for the rail industry.

**A New Era of Predictive Maintenance**  
Aerospace companies have been banging the drum on predictive maintenance for a couple of decades now. The promise of a major breakthrough always seems to be just around the corner. In this post, we face a predictive maintenance task like in other previous related articles: Predictive Maintenance with CNN and Predictive Maintenance with CRNN. The particularity here is that we use only a single high-frequency signal source to produce our final predictions. The application of a specific transformation based on Mel-Frequency ...

**Predictive Maintenance with ResNet | by Marco Cerliani ...**  
Predictive maintenance relies on predicting when equipment or assets will need maintenance based on a set of predetermined parameters. These parameters are continuously monitored via sensors. Near real-time data provided by the sensors triggers an alert that maintenance is needed when a specific parameter, or condition, has been met.

maintenance activities; functions typically associated with more mature levels of predictive maintenance. Once again, we can conclude that PdM 4.0 is widely recognized as a potential improvement to existing maintenance practices, but that the market is still in the early stages of adopting this technology.

The predictive maintenance stack. As with any new and transformative initiative, the fact that there isn't a packaged, out-of-the-box solution for predictive maintenance is a hurdle for most manufacturers. Mature predictive maintenance applications require more than just connected and sensed industrial assets, which in itself is no easy task.

Although regular maintenance is better than failures, we often end up doing the maintenance before it's needed. Hence, it is not an optimal solution from a cost perspective. Predictive maintenance avoids maximizes the use of its resources. Predictive maintenance will detect the anomalies and failure patterns and provide early warnings.
